

NEWSTONE

GROUP

An opportunity was presented in 2018, to build a new company that would provide a fresh outlook in the manufacturing of hardscape products. A team of very experienced industry individuals was assembled, and the Newstone Group was formed.

The goal of Newstone was to build a state-of-the-art manufacturing plant that could provide the highest quality products in the marketplace. The new facility, located in Delta, BC, can not only manufacture top quality classic products but can also provide innovative products and trends for years to come. This combined with our teams commitment to quality and customer service makes Newstone the right choice.

Newstone is 100% locally owned and operated and committed to the best environmental practices in all aspects of our manufacturing and operations. All products we produce meet or exceed standards set by both CSA and ASTM. We look forward to assisting you with all your hardscape projects.

A handwritten signature in black ink that reads "Keith Leach". The signature is fluid and cursive, with the first letters of each name being capitalized and prominent.

President, Newstone Group

Coastal Slate 3-Piece Combo

Premium Finish Face Mix Technology

Photo courtesy of Green Paradise Landscaping

Espresso with Winter Sky Border (Sealed)

Intended to be installed in a truly random pattern this concrete paving stone features the texture of natural sandstone.

TRULY RANDOM PATTERN

The Coastal Slate has an uneven number of pieces of each size on the pallet, allowing you to construct a truly random pattern that emphasizes your own personal style.

COMBO MOLD 3-PIECE:

Size (in)	Type	Sq.ft. per Pallet	Shipping Weight	PCS / Pallet
6" x 12" x 2-3/8" 151mm x 304mm x 60mm	C	108	1361kg / 3000lbs	54
9" x 12" x 2-3/8" 228mm x 304mm x 60mm	E			36
12" x 12" x 2-3/8" 304mm x 304mm x 60mm	F			54

All sizes including 3 mm Spacer Bars

When installing pavers with raised surfaces it is strongly recommended to use a compactor with a rubber pad to prevent burnishing the raised surface.

Parking Lots

Vehicular Traffic

Photo courtesy of Ratan Raymon Construction Ltd. Silver Grey, Midnight Black, and Graphite laid together. Pattern achieved by ordering pallets of three different colours.

Linaro is manufactured on a mixed pallet containing pavers of 2 different widths and 3 different lengths. This change in width and length creates an interesting combination of lineal pavers. Combining colours within the pattern adds further layers of interest. The visual scale is appropriate for everything from city plazas to residential drives.

Dorado Wall Installation Guide

Step 1: Prepare the Trench for Foundation Stone or Road Base

- **Mark the Area:** Use stakes and string lines to outline the area where the retaining wall will be built. Ensure the boundaries are straight and match the desired dimensions of the wall.
- **Dig the Trench:** Excavate a trench along the marked area. The depth and width of the trench should match the specifications for your retaining wall, typically about 6-12 inches deep and twice the width of the blocks.
- **Ensure a Level Base:** The bottom of the trench must be level. Use a leveling tool to ensure precision, as an uneven foundation can compromise the stability of the entire wall.
- **Add Road Base Material:** Fill the trench with a layer of road base gravel or crushed stone. Spread the material evenly and compact it thoroughly using a hand tamper or plate compactor. This creates a stable and well-drained base for the retaining wall.

Note: Make sure the spacer bars are facing down

- **Position the First Block:** Begin at one end of the trench and place the first retaining wall block on the compacted base. Align it carefully with your marked string line or guide to ensure it is in the correct position. Make sure the spacer bars are facing down.
- **Spacer Bar:** Each Dorado wall block is designed with spacer bars at the bottom. These spacer bars must always face downward when placing the blocks. This orientation ensures proper alignment and stability between layers, and helps the blocks interlock securely.
- Before placing each block, double-check that the spacer bars are oriented downward and in contact with the block below. This step is crucial for maintaining the structural integrity of the wall.

Step 2: Lay Down the First Layer and Ensure It Is Level

- **Check for Level:** Use a carpenter's level to check that the block is level in all directions (front-to-back and side-to-side). Adjust by adding or removing small amounts of the base material under the block as needed. This first block is crucial for the entire wall's stability and alignment.

Step 3: Lay Subsequent Layers and Ensure Proper Alignment

- **Position the Next Row:** Start the second row by placing the first block slightly offset from the one below it. This staggered pattern, often called a running bond, adds stability to the wall.
- **Check Alignment:** Align each block carefully with the one below, ensuring it sits securely on the lower layer. Push the blocks back slightly to create a slight backward lean (batter), which helps stabilize the wall against pressure.
- **Secure and Level:** Use a rubber mallet to gently tap the blocks into place and maintain alignment. Continuously check for level as you go to ensure the wall remains even.

Step 4: Finish the Wall to Your Desired Height

- **Cap the Wall (Optional):** If your wall design includes capstones, place them on top of the final row. Apply a landscape block adhesive to the top of the last row and press the capstones firmly into place for a polished, finished look.
- **Backfill and Compact:** Once the wall reaches the desired height, backfill the area behind the wall with gravel or drainage material. This helps reduce pressure on the wall and improves drainage. Compact the backfill in layers to ensure stability.
- **Inspect the Wall:** Do a final check for any uneven blocks or gaps. Make adjustments if necessary to ensure the wall is level, aligned, and stable.

Inclination of the Wall

- To ensure stability, the retaining wall should be built with a slight backward tilt. This is known as "batter." The wall should be inclined at an angle of 2 degrees toward the soil it is retaining. This backward tilt helps counteract the pressure exerted by the soil and improves the wall's structural integrity.

Frequently Asked Questions

WHERE CAN I PURCHASE NEWSTONE GROUP PAVERS AND SLABS?

As the Manufacturer we produce pavers, slabs, and garden walls that meet or exceed all applicable CSA or ASTM specifications. These products are available through our extensive network of Independent Dealers. Their contact information is listed on our website www.newstonegroup.ca. Please contact them for pricing and delivery information.

WHERE CAN I USE INTERLOCKING CONCRETE PAVERS (PAVERS)?

Pavers are crafted to be versatile, suitable for a wide range of applications, including but not limited to patios and roads. The determining factors for their appropriateness in different settings lie in the specific thickness and aspect ratio of the chosen paver.

WHERE CAN I USE VIBROPRESSED SLABS (SLABS)?

These slabs are customarily engineered for non-vehicular spaces, such as patios, walkways, or plazas. Installation methods vary, with slabs being placed either on an aggregate base or supported by pedestals, depending on the specific application requirements.

HOW DO I FIND A CONTRACTOR?

There are many qualified contractors available in our region, typically a good resource for recommending the right contractor(s) is the local dealer. They will be able to match up your project with the right contractor based on scope and timing.

IS THERE AN INDUSTRY ASSOCIATION?

The Concrete Masonry and Hardscapes Association (CMHA) www.masonryandhardscapes.org is the trade association representing the segmental concrete pavement industry in Canada and the United States. Excellent resource for technical specifications and education, including tech spec 5, which dealing with cleaning and sealing your pavers and slabs, is available at: <https://www.masonryandhardscapes.org/resource/pav-tec-005-22>.

SHOULD I SEAL MY PAVERS OR SLABS?

Sealing is essential to protect against stains from organic materials, food, other contaminants, and vehicular activities. It not only preserves the appearance but also guards against long-term damage, maintaining both aesthetics and structural integrity.

HOW DO I PREVENT WEEDS?

Weeds occur when there are seed pods blown in from adjacent properties that fall into the joints and germinate. Polymeric sand is recommended as a best practice tool as Polymeric sand

is designed to resist seed pods and complete through compaction a superior interlock. When installing Polymeric sand please read and follow the manufacturer's instructions, this will aid you in accomplishing a successful install and avoiding Polymeric sand haze.

SHOULD I INSTALL PAVERS FROM DIFFERENT PALLETS OR ONE PALLET AT A TIME?

When installing pavers and slabs it is highly recommended to pull from 3 – 5 pallets at a time to avoid the striping effect in the photo below. The variation in tone is helpful in increasing the diversity of the visual experience but is only effective when they are properly dissipated throughout. The same is true for the solitary colours.

WHAT IS EFFLORESCENCE?

After several weeks or months, you might notice a white haze emerging on your paver surface, a phenomenon known as efflorescence. It can manifest randomly or in specific areas, with a more noticeable effect on dark-coloured pavers. This white haze may initially give the impression of fading colours, but when wet, it disappears, revealing enhanced paver colours. However, the white haze reappears as the pavers dry.

Efflorescence is a completely natural occurrence that resolves over time. There's no need for concern about damage or defects in your pavers; rather, it's a natural process common to all cement-based and many other paving products. Given time and exposure to the elements, efflorescence typically corrects itself.

WHAT IS THE CHEMISTRY OF EFFLORESCENCE?

All concrete products, including pavers, contain cement that produces lime or water-soluble calcium oxide. Lime may also be present in bedding sand, aggregate base materials, or soil. Despite their solid and dense nature, concrete pavers have microscopic capillaries running from the interior to the surface. Moisture from various sources, such as rain, sprinkler systems, poor drainage, or dew, infiltrates these capillaries.

Calcium oxide within the paver reacts with the water in the capillaries, forming calcium hydroxide. This compound rises to the surface, reacts with airborne carbon dioxide, and creates a white haze of calcium carbonate. When surface moisture evaporates, the efflorescence becomes visible.

HOW TO REMOVE EFFLORESCENCE?

While most paver producers incorporate chemical additives to reduce efflorescence likelihood, complete elimination is challenging due to its natural occurrence in hardened concrete. Efflorescence ceases when no more calcium hydroxide is available to migrate to the surface.

Chemical cleaners can remove surface efflorescence, enhancing the natural beauty of your concrete paver project. Consult your paver supplier for suitable cleaners.

WHEN WILL EFFLORESCENCE STOP?

Efflorescence stops when the supply of calcium hydroxide is depleted. In areas with frequent rain and sun, it may cease quickly, while drier climates might prolong the process. Generally, efflorescence stops developing in about 18 to 24 months.

Two images displayed above depict the project's progression over a 9-month timeline, showcasing the initial state and the final outcome achieved without any cleaning intervention.

WILL IT GO AWAY NATURALLY?

Efflorescence will naturally disappear over time as rainwater washes it away. Urban areas with acidic rainfall may see faster removal than rural areas due to various contributing factors.

CAN IT BE REMOVED WITHOUT THE WAIT?

Efflorescence can be cleaned with commercially available cleaners designed for concrete pavers. Prompt cleaning after its appearance is crucial, and it may need to be repeated until the efflorescence stops. Exercise caution with cleaners containing acids and detergents, following label directions and environmental regulations. Conduct a small test before applying cleaners to the entire area, ensuring the pavers are dry and free from efflorescence before applying sealers.

IS IT NORMAL TO HAVE TONE DIFFERENCES IN PAVERS?

In the realm of hardscape concrete pavers, it's quite common to encounter variations in tone. The intricate process of curing is essentially completed as these pavers are exposed to the elements, including the nurturing touch of rain and the radiant embrace of the sun. This exposure not only adds to the overall durability of the concrete but also plays a pivotal role in harmonizing the colour tones.

Furthermore, the journey to a seamless appearance continues post-installation. After these pavers undergo the meticulous steps of sanding and compacting, a transformation unfolds. Over a brief span of time, the pavers gracefully evolve, seamlessly evening out any initial discrepancies in colour. The result is not just a completed project but a testament to the dynamic interplay between craftsmanship and the natural elements, creating a hardscape that embodies both resilience and aesthetic appeal.

Why Choose Newstone Group Concrete Pavers, Slabs, or Garden Walls

AESTHETICS AND FLEXIBILITY

Pavers are considered by many homeowners and designers as a more attractive and adaptable choice than asphalt or poured concrete for their hardscape projects. Concrete pavers are available in a variety of colours, shapes, sizes, and textures. Concrete paver colours run the gamut from earth tones to rich charcoals. With their available paver sizes endless possibilities can be explored in the laying patterns from a typical herringbone to a 4- or 5-piece geometric work of art. All our Concrete Pavers, Slabs, and Garden Walls add curb appeal to any project.

DURABILITY

Our Concrete Pavers, Slabs and Garden Walls are produced in our Newstone Group manufacturing plant to exacting CSA and ASTM Standards. These standards include dimensional tolerances, strength tolerances, and Freeze Thaw tolerances. This ensures that they are a good long-term solution for your hardscape needs. Whether you are installing a driveway, a walkway, a patio, a pool surround, or a large project our products will endure.

MAINTENANCE

Properly installed pavers and slabs are a low maintenance product and will provide an attractive surface for decades when properly installed. If a concrete paver or slab needs replacement or an addition to the project is required, the paver or slab is simply pulled out in the case of repair and swapped, or in the case of the project expansion, more product is ordered from the Dealer. The Dealer delivers our factory produced pallets to your site.

COST

The cost of concrete pavers and slabs is substantially less than natural stone, with concrete pavers providing a similar aesthetic appearance. When factoring in maintenance costs and project durability, concrete pavers, and slabs, with their enhanced durability, flexibility, and aesthetics, are extremely affordable compared to other outdoor surface choices.

SAFETY

Pavers provide a safe, slip-resistant surface for pedestrian, vehicular and pool projects.
